TECHNICAL SKILLS

- JavaScript, TypeScript, React, Vue, Redux, Pinia, C#, .NET, SQL Server, Visual Studio, Azure DevOps, Git

WORK EXPERIENCE

Full-Stack Developer 3, Crutchfield

October 2021 – Present

- Drive end-to-end feature development for the public-facing e-commerce platform, bridging C# and .NET backend services with responsive Vue interfaces while leveraging A/B testing to maximize performance, conversion, and accessibility.
- Spearheaded the architecture of an internal homepage editor, defining robust data contracts and database updates to support dynamic product carousels and embedded video.
- Architected the migration of the global site header to Vue, implementing a server-side placeholder strategy to mask component mounting latency and optimize perceived frontend performance.
- Implemented a new API to retrieve data for the website's product results page, improving web performance by 25%.
- Modernized a console application for scanner equipment in order to manage inventory, resulting in 4 hours of work saved per day.
- Integrated Google reCAPTCHA into web forms to enhance security, mitigate SQL injection vulnerabilities, and protect against automated threats.

Software Engineer Intern, Investure

September 2019 – June 2021

- Engineered React applications tailored for investment management.
- Developed .NET Web API endpoints to view and modify data on financial transactions.
- Converted UI designs and mockups into high quality code and reusable components.

Software Engineer Intern, Reonomy

May 2019 – August 2019

- Contributed to the frontend migration of a commercial real estate web application from Angular to React, leveraging GitHub for version control and engaging in rigorous code reviews to enforce industry best practices.

EDUCATION

Master of Science, Cybersecurity, Georgia Institute of Technology

Expected May 2028

Bachelor of Arts, Computer Science, University of Virginia

May 2021

PROJECTS

AI Malware Detection Agent: Georgia Tech CS 6262

- Built a multi-agent AI system with the OpenAI API and CrewAI to classify network traffic and detect Mirai botnet infections, DDoS attacks, and previously unseen variants.
- Applied prompt engineering to specialize collaborating agents, and developed a Retrieval-Augmented Generation (RAG) knowledge base to ground the agent reasoning in domain-specific threat intelligence.

CO2 Emissions Dashboard: github.com/seanrmcgovern/CO2EmissionsAPI

- Designed and published a React web application on Vercel, utilizing Recharts to translate environmental data into an interactive dashboard of dynamic graphs and charts.
- Developed a .NET Web API with endpoints to query carbon emissions data for major countries, backed by a SQLite database.
- Deployed the API to Microsoft Azure Cloud Services, utilizing Azure App Services and configuring CI/CD pipelines for streamlined updates.

Pinball Machine Tracker: github.com/seanrmcgovern/Pinball-Tracker

- Built a web application with React, Redux, and Django, enabling users to view and contribute crowdsourced pinball machine locations, visualize them on an interactive map, create accounts, and save favorite locations.
- Integrated Heroku with GitHub to enable continuous integration and deployment.
